

Domain Diagram

Conceptual Layers

- Application

The business purpose of the system
(All about Elevators and nothing else)
- Service

Each general purpose domain can be configured to support its client without modeling anything in the client subject matter
(Models not about Elevators at all, but the instance population data is!)
- Model Platform

All modeled domains become instance data in the Model Platform domain.
Applies xUML rules to execute the models on a class of target platform
- Software Platform

A bundle of domains that you don't model because they already exist as code
